Insurance examines the law and practice of marine cargo insurance on a worldwide basis, and provides the busy practitioner the information needed to quickly and accurately resolve cargo insurance coverage issues, wherever they may arise. The book concentrates on the law in the United States and England. It then examines other countries with a common law tradition including Hong Kong, Singapore, Japan and Australia. The civil law systems are highlighted in a number of key trading nations: Italy, Germany, France and Norway. The book includes chapters on South Africa as well as the People's Republic of China. It concludes with a comparative law

chapter concentrating on issues that arise in practice in cargo coverage cases. This chapter also examines how the Institute Cargo Clauses have been construed by Courts worldwide. The appendices include the standard cargo policy insurance terms used in each jurisdiction, some translated for the first time for this volume, as well as translations of the relevant statutes and commercial codes, many not available elsewhere.

This book examines key risks that the Nation's critical energy infrastructure is confronting and the ways in which the insurance industry can help manage these risks, including how it

identifies, assesses, and manages them and their potential impacts. Today, weather-related incidents account for the majority of economic losses in the insurance industry as well as in the critical infrastructure sectors. In addition to the traditionally-recognized natural hazards, critical energy infrastructure faces significant emerging threats, including cybersecurity and space weather risks. While the United.

This study examined the risks and risk management issues involved with the implementation by electric power utilities of compressed air energy storage and underground pumped hydro storage systems.

The results are listed in terms of relative risks for the construction and operation of these systems in different geologic deposits, with varying amounts of pressurization, with natural or man-made disasters in the vicinity of the storage equipment, and with different modes of operating the facilities. This is the final report for the DOE-NETL grant entitled 'Creating New Incentives for Risk Identification & Insurance Processes for the Electric Utility Industry' and later, 'Energy & Risk Transfer Assessment'. It reflects work done on projects from 15 August 2004 to 29 February 2008. Projects were on a variety of topics, including commercial insurance for electrical utilities, the Electrical Reliability Organization, cost recovery by Gulf State electrical utilities after major hurricanes, and review of state energy emergency plans. This Final Technical Report

documents and summarizes all work performed during the award period, which in this case is from 15 August 2004 (date of notification of original award) through 29 February 2008. This report presents this information in a comprehensive, integrated fashion that clearly shows a logical and synergistic research trajectory, and is augmented with findings and conclusions drawn from the research as a whole. Four major research projects were undertaken and completed during the 42 month period of activities conducted and funded by the award; these are: (1) Creating New Incentives for Risk Identification and Insurance Process for the Electric Utility Industry (also referred to as the 'commercial insurance' research). Three major deliverables were produced: a pre-conference white paper, a two-day facilitated stakeholders workshop conducted at George Mason University, and a post-workshop report with findings and recommendations. All deliverables from this work are published on the CIP website at <http://cipp.gmu.edu/projects/DoE-NETL-2005.php>. (2) The New Electric Reliability Organization (ERO): an examination of critical issues associated with governance, standards development and implementation, and jurisdiction (also referred to as the 'ERO

study'). Four major deliverables were produced: a series of preliminary memoranda for the staff of the Office of Electricity Delivery and Energy Reliability ('OE'), an ERO interview protocol and stakeholder/experts interviews, a formal research paper, and a data quality and availability study of North American Electric Reliability Corporation/ERO's disturbances and outages working group ('DAWG') databases. (3) Critical Electric Power Infrastructure Recovery and Reconstruction: Issues & New Policy Initiatives in Four Gulf Coast States After 2005's Catastrophic Hurricanes (also referred to as the 'Gulf Coast cost recovery

study'). Four deliverables were produced: the original research paper providing preliminary findings and recommendations (29 September 2006), a formal presentation of that report to officials, staff and invited guests at OE's Washington, DC headquarters, a series of update memoranda and quarterly activity updates (1 November 2006 through Q3-2007), and a final cumulative update of the original research report (February 2008). Documentation and information on these research activities can be found on the CIP website at <http://cipp.gmu.edu/projects/DoE-NETL-2006.php>. (4) Evaluation of State Energy Emergency

Response Plans (also referred to as the 'SEERP project'). Two major deliverables were produced: an evaluation of 47 SEERPs with findings, statistical analyses, geospatial renderings (mappings of the States whose plans were evaluated with statistical analysis underpinnings) and recommendations (17 September 2007), and a major revision to the original deliverable to include one additional plan (Missouri), with fully updated findings, statistical analyses, geospatial renderings, and recommendations (Revision 1, 29 February 2008).

New Players in the Delivery of Energy-efficient and Renewable Energy Products and Services
CRC Press

Among the key barriers to investment in

energy efficiency improvements are uncertain about attaining projected energy savings and apprehension about potential disputes over these savings. The fields of energy management and risk management are thus intertwined. While many technical methods have emerged to manage performance risks (e.g. building commissioning), financial risk transfer techniques are less developed in the energy management arena than in other more mature segments of the economy. Energy Savings Insurance (ESI) - formal insurance of predicted energy savings - is one method of transferring financial risks away from the facility owner or energy services contractor. ESI offers a number of significant advantages over other forms of financial risk transfer, e.g. savings guarantees or performance bonds. ESI providers manage risk via pre-construction design review as well as post-construction commissioning and measurement and verification of savings. We found that the two most common criticisms of ESI - excessive pricing and onerous exclusions - are not born out in practice. In fact, if properly applied, ESI can potentially reduce the net cost of energy savings projects by reducing the interest rates charged by lenders, and by increasing the level of savings through quality

control. Debt service can also be ensured by matching loan payments to projected energy savings while designing the insurance mechanism so that payments are made by the insurer in the event of a savings shortfall. We estimate the U.S. ESI market potential of \$875 million/year in premium income. From an energy-policy perspective, ESI offers a number of potential benefits: ESI transfers performance risk from the balance sheet of the entity implementing the energy savings project, thereby freeing up capital otherwise needed to "self-insure" the savings. ESI reduces barriers to market entry of smaller energy services firms who do not have sufficiently strong balance sheets to self-insure the savings. ESI encourages those implementing energy saving projects to go beyond standard, tried-and-true measures and thereby achieve more significant levels of energy savings; and ESI providers stand to be proponents of improved savings measurement and verification techniques, as well as maintenance, thereby contributing to national energy savings objectives and perhaps elevating the quality of information available for program evaluation. Governmental agencies have been pioneers in the use of ESI and could continue to play a role in developing this innovative risk-transfer mechanism. There is

particular potential for linkages between ESI and the ENERGY STAR (registered trademark) Buildings Program. It is likely that ENERGY STAR (registered trademark)-labeled commercial buildings (which have lower performance risk thanks to commissioning) would be attractive to providers of energy savings insurance. Conversely, the award of energy savings insurance to an ENERGY STAR (registered trademark)-labeled building would raise the perceived credibility of the Label and energy savings attributed to the Program.

Essays on Weather Indexed Insurance and Energy Use in Mexico Council on Foreign Relations Press

For the future, significant progress could be made through interdisciplinary collaborative applied research (i.e., integrating the actuarial sciences with the "physical" or "engineering" sciences). This collaboration could be sponsored jointly by the U.S. Department of Energy and the insurance and risk management communities (as well as working through the insurance regulatory and rate-making processes).

Hearings Before the Subcommittee on Commerce, Consumer Protection, and Competitiveness of the Committee on Energy and Commerce, House of Representatives, One Hundredth Congress, Second

Session Academic Press

This dissertation consists of three chapters that analyze the effects of social development programs on productivity, risk management strategies, and energy consumption among the poorest population in Mexico. Weather shocks have important negative impacts on poor rural households' livelihood as they are not only closer to subsistence and more vulnerable but also depend on the weather for survival. Nonetheless, due to high administrative costs and information problems insurance markets tend to leave this part of the population unprotected. Similarly, poor rural households usually make use of

cheap yet inefficient and potentially harmful sources of energy for cooking, lighting, and heating their homes. This situation does not only affect their health and daily activities, but also keeps them trapped in poverty. In the following chapters I discuss several ways in which government action can in fact improve this population's well-being. The first chapter entitled "Drought and Retribution: Evidence from a large scale Rainfall-Indexed Insurance Program in Mexico" studies the effects of the recently introduced rainfall-indexed insurance on farmers' productivity, risk management strategies, and per capita income and expenditures in Mexico. Weather

shocks are a major source of income fluctuation and most of the world's poor lack insurance coverage against them. In addition, the absence of formal insurance contributes to poverty traps as investment decisions are conflicted with risk management decisions: risk-averse farmers tend to underinvest and concentrate in the production of lower yielding yet safer crops. Recently, weather-indexed insurance has gained increased attention as an effective tool providing small-scale farmers coverage against aggregate shocks. However, there is little empirical evidence about its effectiveness. According to the Ministry of Agriculture, 80 percent of

agricultural catastrophic risk in Mexico stems from droughts. Therefore, in 2003 it implemented weather-indexed insurance as a pilot in five counties in the Mexican State of Guanajuato, and by 2008 it already covered almost 1.9 million hectares representing 15 percent of rain-fed agricultural land. The main identification strategy takes advantage of the variation across counties and across time in which the insurance was rolled-out. We find that insurance presence in treated counties has significant and positive effects on maize productivity. In fact, we find that insurance presence at the county level increases maize

yields by more than 5 percent. Similarly, we find that insurance presence at the county level has had a positive effect on rural households' per capita expenditure and income of a magnitude close to 8 percent. However, we find no significant relation between insurance presence and the number of hectares destined to maize production. The second chapter entitled "Voters Response to Natural Disasters Aid: Quasi-Experimental Evidence from Drought Relief Payment in Mexico" estimates the effect of a government climatic contingency transfer allocated through the recently introduced rainfall indexed insurance on the 2006 Presidential election returns in Mexico. Using the discontinuity in payment based on rainfall accumulation measured on local weather stations that slightly deviate from a pre-established threshold, we show that voters reward the incumbent presidential party for delivering drought relief compensation. We find that receiving indemnity payments leads to a significant increase in average electoral support for the incumbent party of approximately 7.6 percentage points. Our analysis suggests that the incumbent party is rewarded by disaster aid recipients and punished by non-recipients. This chapter provides evidence that voters evaluate government actions and respond to

disaster spending contributing to the literature on retrospective voting. The third and final chapter entitled "Conditional Cash Transfers schemes and Households' Energy Response in Mexico" analyzes the relationship between income and energy use in poor households in Mexico using household expenditure surveys that were collected to evaluate the poverty alleviation program "Oportunidades". We argue that Oportunidades cash transfers provide an income shock that is exogenous to a household's energy demand, allowing us to estimate short-run and long-run income elasticities for energy use. Short-run estimates hold household's appliance stock constant and long-run estimates model the household's decision to acquire new appliances. As a general estimation strategy households' fixed-effects are included. We also use instrumental variable estimation and a matching difference-in-differences estimator to check for robustness and correct for pre-selection unbalances between treatment and control groups. Results suggest significant differences between long-run and short-run elasticities as households emerging from poverty become first-time purchasers of energy-using appliances. In particular, we find small and not significant effects of

cash-transfers on short-run energy consumption expenditure, but find significant and important effects of cumulative conditional cash-transfers on appliance acquisition (i.e. refrigerators and gas stoves). This has important policy implication since poverty alleviation programs like Oportunidades conditional cash transfers program, although not evident in the short run, have significant effects on energy demand.

Climate change affects virtually every aspect of the U.S. energy system. As climatic effects such as rising seas and extreme weather continue to

appear across many geographies, U.S. energy infrastructure is increasingly at risk. The U.S. Gulf Coast--which is home to 44 percent of total U.S. oil refining capacity and several major ports--is highly vulnerable to flooding events and dangerous ocean surges during severe storms and hurricanes. The link between water availability and energy and electricity production creates another layer of risk to U.S. energy security. Climate risk could manifest not only in physical damages, but also in financial market failures. Climate change-related challenges could impede energy firms' access to capital markets or private insurance markets. Already, climate-

related risks have created severe financial problems at a handful of U.S. energy firms, forcing them to interrupt their sales of energy to consumers in particular locations. Over time, climatic disruptions to domestic energy supply could entail huge economic losses and potentially require sizable domestic military mobilizations. The United States is ill prepared for this national security challenge, and public debate about emergency preparedness is virtually nonexistent. To explore the challenges of climate risk to the U.S. energy system and national security, the Council on Foreign Relations organized a two-day workshop in New York,

on March 18 and 19, 2019. The gathering of fifty participants included current and former state and federal government officials and regulators, entrepreneurs, scientists, investors, financial- and corporate-sector leaders, credit agencies, insurers, nongovernmental organizations, and energy policy experts. During their deliberations, workshop participants explored how climate-related risks to U.S. energy infrastructure, financial markets, and national security could be measured, managed, and mitigated. Impact of Climate Risk on the Energy System summarizes the insights from this workshop and includes

contributions from seven expert authors delving into related topics.

Quantitative models are omnipresent -but often controversially discussed- in today's risk management practice. New regulations, innovative financial products, and advances in valuation techniques provide a continuous flow of challenging problems

for financial engineers and risk managers alike. Designing a sound stochastic model requires finding a careful balance between parsimonious model assumptions, mathematical viability, and interpretability of the output. Moreover, data requirements and the end-user training are to be considered as well. The KPMG Center of Excellence in Risk Management conference Risk Management Reloaded and this proceedings volume contribute to bridging the gap between academia -providing methodological advances- and practice -having a firm understanding of the economic conditions in which a given model is used. Discussed fields of application range

from asset management, credit risk, and energy to risk management issues in insurance. Methodologically, dependence modeling, multiple-curve interest rate-models, and model risk are addressed. Finally, regulatory developments and possible limits of mathematical modeling are discussed.

The Insurance Risk and

Legal Liability in Nuclear Activities CRC Press

This book examines key risks that the Nations critical energy infrastructure is confronting and the ways in which the insurance industry can help manage these risks, including how it identifies, assesses, and manages them and their potential impacts. Today, weather-related incidents account for the majority of economic losses in the insurance industry as well as in the critical infrastructure sectors. In addition to the traditionally-recognised natural hazards, critical energy infrastructure faces significant emerging threats, including cybersecurity and space weather risks. While the United

States has a large, mature insurance market, developing insurance mechanisms for protecting critical infrastructure from these emerging risks remains a significant challenge. The lack of historical data on the frequency and severity of these events, the changing nature of technologies impacted by them, as well as the inherent uncertainties posed by these risks make it difficult to accurately assess these emerging risks and develop proper insurance products. Insurance instruments can be a useful risk mitigation tool for critical infrastructure by encouraging resilience-enhancing investments and facilitating recovery after a disaster. However, due to the

increased interdependencies across various critical infrastructure systems and sectors as well as the growing dependence of today's society on the critical infrastructure functions and advanced technologies, the question of insurability of critical infrastructure against emerging risks faces new challenges.

The announcement of a hydrogen fuel

initiative in the President's 2003 State of the Union speech substantially increased interest in the potential for hydrogen to play a major role in the nation's long-term energy future. Prior to that event, DOE asked the National Research Council to examine key technical issues about the hydrogen economy to assist in the development of its hydrogen R&D program. Included in the assessment were the current state of technology; future cost estimates; CO₂ emissions; distribution, storage, and end use considerations; and the DOE RD&D program. The report provides an assessment of hydrogen as a fuel in the nation's future energy economy and

describes a number of important challenges that must be overcome if it is to make a major energy contribution. Topics covered include the hydrogen end-use technologies, transportation, hydrogen production technologies, and transition issues for hydrogen in vehicles.

REVIEW OF ENERGY INSURANCE RISK

- First of all, I would have to say I was greatly satisfied with the delivery time of my book. I was expecting it within 3-4 days and got it next day. The product itself is very easy to understand.

Every section of the ASVAB, the scoring, and the AFQT is broken down. There is a lesson for each section and three practice exams along with a practice AFQT exam. There is also a list of scores needed on the AFQT for each branch and each career for each branch. Definitely worth the low price!

- If I wouldn't have utilized this for my asvab I would have done horribly. I'm so glad I picked this up!
