Power Generation from Vehicle Speed Humps In the proposed capstone project, a mechanism fixed under speed breakers was designed. The final design was then manufactured and tested for the purpose of generating power from the vehicles force over it. The design works when a vehicle passes over the speed breaker, the linear movement that is subjected on the speed breaker will force it to go down which will activate a mechanism in order to generate power. The setup was down scaled to stand a maximum value of 90 kgs due to the cost and time limitation. The project is done in order to use mechanical engineering theories in designing. The report of the design goes through various stages; [sic] first, literature review done on previous patents and journals that helped having wider knowledge on building the design, as well as mechanical codes and standards to be followed in the mathematical equations. Second, the conceptual design stage where multiple alternative

sketches on the mechanism are proposed along with a decision matrix done by assessing and comparing the designs together based on important criterions that would be assigned for any mechanical design. This was beneficial in choosing a final design of the capstone project. The detailed design chapter showed the steps of calculations made for designing each part of the mechanism based on mechanical equations, this included the speed breaker design, gear ratios, shaft diameter, the input power that is expected on the mechanism by the vehicle, and the wooden box covering the design. This chapter also covered the stress analysis of the three shafts, the gears and the rack. The detailed design section used three commercial programs: SolidWorks for the drawing of the components, and Ansys for the finite element analysis. The testing of the design took place in an outdoor environment, where the model is buried underground showing only the speed breaker. The experimental testing took 3 days of operation process, the final results were measured by the generator and the battery attached to the last gear shaft where the power generated from the design at a low speed , in the form of electricity is calculated by the voltage and current and found to be 10.9 Watts for 90 kg. A component in the America's Energy Future study, Electricity from Renewable Resources examines the technical potential for electric power generation with alternative sources such as wind, solar-photovoltaic, geothermal, solar-thermal, hydroelectric, and other renewable sources. The book focuses on those renewable sources that show the most promise for initial commercial

deployment within 10 years and will lead to a substantial impact on the U.S. energy system. A quantitative characterization of technologies, this book lays out expectations of costs, performance, and impacts, as well as barriers and research and development needs. In addition to a principal focus on renewable energy technologies for power generation, the book addresses the challenges of incorporating such technologies into the power grid, as well as potential improvements in the national electricity grid that could enable better and more extensive utilization of wind, solar-thermal, solar photovoltaics, and other renewable technologies.

Can the electric and magnetic fields (EMF) to which people are routinely exposed cause health effects? This volume assesses the data and draws conclusions about the consequences of human exposure to EMF. The committee examines what is known about three kinds of health effects associated with EMF: cancer, primarily childhood leukemia; reproduction and development; and neurobiological effects. This book provides a detailed discussion of hazard identification, dose-response assessment, exposure assessment, and risk characterization for each. Possible Health Effects of Exposure to Residential Electric and Magnetic Fields also discusses the tools available to measure exposure, common types of exposures, and what is known about the effects of exposure. The committee looks at correlations between EMF exposure and carcinogenesis, mutagenesis, neurobehavioral effects, reproductive and developmental effects, effects on melatonin and other neurochemicals,

and effects on bone healing and stimulated cell growth.

The rapid increase of cloud computing, high performance computing (HPC) and the vast growth in Internet and Social Media use have aroused the interest in energy consumption and the carbon footprint of Data Centres. Data Centres primarily contain electronic equipment used for data processing (servers), data storage (storage equipment), and communications (network equipment). Collectively, this equipment processes, stores, and transmits digital information and is known as information technology (IT) equipment. Advanced Concepts for Renewable Energy Supply of Data Centres introduces a number of technical solutions for the supply of power and cooling energy into Data

Centres with enhanced utilisation of renewable energy sources in order to achieve low energy Data Centres. Because of the high energy density nature of these unique infrastructures, it is essential to implement energy efficiency measures and reduce consumption before introducing any renewable energy source. A holistic approach is used with the objective of integrating many technical solutions such as management of the IT (Information Technology) load, efficient electrical supply to the IT systems, Low-Ex air-conditioning systems, interaction with district heating and cooling networks, re-use of heat, free cooling (air, seawater, groundwater), optimal use of heat and cold storage, electrical storage and integration in smart grids. This book is therefore a catalogue of advanced technical concepts that could be integrated into Data Centres portfolio in order to increase the overall efficiency and the share of renewable energies in power and cooling supply. Based on dynamic energy models implemented in TRNSYS some concepts are deeply evaluated through yearly simulations. The results of the simulation are illustrated with Sankey charts, where the energy flows per year within the subsystems of each concept for a selected scenario are shown, and graphs showing the results of parametric analysis. A set of environmental metrics (as the non-renewable primary energy) and financial metrics (CAPEX and OPEX) as well of energy efficiency metrics like the well-known PUE, are described and used to evaluate the different technical concepts.

New information and strategies for managing the energy crisis from the perspective of growing economies are presented. Numerous case studies illustrate the particular challenges that developing countries, many of which are faced with insufficient resources, encounter. As a result, many unique strategies to the problems of energy management an conservation, environmental engineering, clean technologies, biological and chemical waste treatment and waste management have been developed.

The primary human activities that release carbon dioxide (CO₂) into the atmosphere are the combustion of fossil fuels (coal, natural gas, and oil) to generate electricity, the provision of energy for transportation, and as a consequence of some industrial processes. Although aviation CO₂ emissions only make up approximately 2.0 to 2.5 percent of total global annual CO₂ emissions, research to reduce CO₂ emissions is urgent because (1) such reductions may be legislated even as commercial air travel grows, (2) because it takes new technology a long time to propagate into and through the aviation fleet, and (3) because of the ongoing impact of global CO₂ emissions. Commercial Aircraft Propulsion and Energy Systems Research develops a national research agenda for reducing CO₂ emissions from commercial aviation. This report focuses on propulsion and energy technologies for reducing carbon emissions from large, commercial aircraft—single-aisle and twin-aisle aircraft that carry 100 or more passengers—because such aircraft account for more than 90 percent of

global emissions from commercial aircraft. Moreover, while smaller aircraft also emit CO₂, they make only a minor contribution to global emissions, and many technologies that reduce CO₂ emissions for large aircraft also apply to smaller aircraft. As commercial aviation continues to grow in terms of revenue-passenger miles and cargo ton miles, CO₂ emissions are expected to increase. To reduce the contribution of aviation to climate change, it is essential to improve the effectiveness of ongoing efforts to reduce emissions and initiate research into new approaches.

Americans' safety, productivity, comfort, and convenience depend on the reliable supply of electric power. The electric power system is a complex "cyber-physical" system composed of a network of millions of components spread out across the continent. These components are owned, operated, and regulated by thousands of different entities. Power system operators work hard to assure safe and reliable service, but large outages occasionally happen. Given the nature of the system, there is simply no way that outages can be completely avoided, no matter how much time and money is devoted to such an effort. The system's reliability and resilience can be improved but never made perfect. Thus, system owners, operators, and regulators must prioritize their investments based on potential benefits. Enhancing the Resilience of the Nation's Electricity System focuses on identifying, developing, and implementing strategies to increase the power system's resilience in the face of events that can cause large-area, long-duration outages: blackouts that extend over multiple service areas and last several days or

longer. Resilience is not just about lessening the likelihood that these outages will occur. It is also about limiting the scope and impact of outages when they do occur, restoring power rapidly afterwards, and learning from these experiences to better deal with events in the future.

REVIEW OF ELECTRICITY GENERATION USING SPEED BREAKER

- The Shelters of Stone could have been so much better. I looked forward with great anticipation to this book and getting reacquainted with the characters, but have to admit I was disappointed. I found myself skipping entire sections to get to the action, and learned little new about Ayla and Jondalar. Perhaps I made the mistake of reading this after devouring a book that has been highly recommended by other readers here: Shade of the Maple by Kirk Martin. Unlike Auel, Martin keeps the story focused squarely on the characters and their unfolding drama, which results in a page-turning plot that moves quickly toward a powerful, memorable ending. Incredible. Rather than resort to steamy sex scenes, Martin uses subtle interactions between well-developed characters to heighten the "connection" on a deep level, and you never leave this story. I hope that Auel will use a similar style in the next novel to draw me back into her drama.

- AFter waiting so long I felt cheated after reading this book which could have been summarized in one sentence. Ayla reaches final destination, mates, and has Jondalar's baby. The rest of the book is totally plagiarist from the other books in the series. All the events are exactly the same, just the names are changed. There was absolutely no new plots involved. What a shame.
