As Vincent De Marcos watches a barge carry off a supersonic airliner to a museum in November 2003, he can't help but think: The old boat still has a place in the world, but the Concorde apparently does not. For the first time in the history of transportation, distances have become longer, and it feels like a funeral—only they are burying the future instead of a person. No one seems to care, but sixteen years later Vincent still can't help thinking about what the world has lost. To him, we still live in the past, and smartphones and tablets, as amazing as they are, will never change that. He struggles to focus on work at the Rigor Insurance building and looks forward to sometimes flirting with his friend, the beautiful Nuria Guzman. It's only by chance that he sees a presentation about the supposed existence of a forgotten Jewish community composed of elite, scientific thinkers that have been hiding in Antarctica since World War 2. Throwing caution to the wind, he decides to search for the community, even though it means risking his life. If he finds it, he'll be forced to decide whether or not the scientists can be trusted to help the world live up to its promise in Future Man. Inspired by the findings of historical researcher Rainer Daehnhardt who, in 2005, was awarded "Top One Hundred Scientist 2005" by Cambridge, for his historical scientific research, namely his findings on the activities in Antarctica by the German of the 3rd Reich in the 1930/40s and the secret operations, led by allied forces - especially the U.S. - to find them, long after WWII was over. He has published 80 books and over 600 scientific articles.

For this set of lectures we assumed that the reader has a reasonable back ground in physics and some knowledge of general relativity, the modern theory of gravity in macrophysics, and cosmology. Computer methods are presented by leading experts in the three main domains: in numerics, in computer algebra, and in visualization. The idea was that each of these subdisciplines is introduced by an extended set of main lectures and that each is conceived as being of comparable 'importance. Therefore we believe that the book represents a good introduction into scientific computing for any student who wants to specialize in relativity, gravitation, and/or astrophysics. We

took great care to select lecturers who teach in a comprehensible way and who are, at the same time, at the research front of their respective field. In numerics we had the privilege of having a lecturer from the National Center for Supercomputing Applications (NCSA, Champaign, IL, USA) and some from other leading institutions of the world; visualization was taught by a visualization expert from Boeing; and in computer algebra we took recourse to practitioners of different computer algebra systems as applied to classical general relativity up to quantum gravity and differential geometry.

Nonparametric function estimation with stochastic data, otherwise known as smoothing, has been studied by several generations of statisticians. Assisted by the ample computing power in today's servers, desktops, and laptops, smoothing methods have been finding their ways into everyday data analysis by practitioners. While scores of methods have proved successful for univariate smoothing, ones practical in multivariate settings number far less. Smoothing spline ANOVA models are a versatile family of smoothing methods derived through roughness penalties, that are suitable for both univariate and multivariate problems. In this book, the author presents a treatise on penalty smoothing under a unified framework. Methods are developed for (i) regression with Gaussian and non-Gaussian responses as well as with censored lifetime data; (ii) density and conditional density estimation under a variety of sampling schemes; and (iii) hazard rate estimation with censored life time data and covariates. The unifying themes are the general penalized likelihood method and the construction of multivariate models with built-in ANOVA decompositions. Extensive discussions are devoted to model construction, smoothing parameter selection, computation, and asymptotic convergence. Most of the computational and data analytical tools discussed in the book are implemented in R, an open-source platform for statistical computing and graphics. Suites of functions are embodied in the R package *gss*, and are illustrated throughout the book using simulated and real data examples. This monograph will be useful as a reference work for researchers in theoretical and applied statistics as well as for those in other related disciplines. It can also be used as a text for graduate level courses on the subject. Most of the materials are accessible to a second year graduate student with a good training in calculus and linear algebra and working knowledge in basic statistical inferences such as linear models and maximum likelihood estimates.

REVIEW OF E7J ENGINE

- Michell's mammoth novel is given a wonderful treatment by Heritage (the set is designed by Ted Gensamer.)² Volumes in 2 slipcases in two-cloth bindings of cream and green. Gold print to the spines with magnolia decorations; image of young Scarlet to the front cover in gold. Sewn bindings. 5.5 pounds. John Groth illustrations: something like ten color illustrations per volume, some half page and a few two-page spreads. There are also about 30 b&w; pen and ink illustrations per volume. The text is laid out in double columns which means that the books are readable -- not too heavy in the hand -- but still easy on the eye. Groth's images are definitely influenced by the film but he's interested in the characters in the novel rather than the actors in the movie. All in all, a deluxe yet classy piece of work.

- I placed an order for a new one, but got a used one with several markers and dirty. So, I am so disappointed with this book.
