REVIEW OF INTRODUCTION TO ELECTRONIC CIRCUIT DESIGN BY SPENCER GHAUSI

- This book is definitely the most in depth book on environmental nutrition there is to date. It delves into the many issues relating to environmental nutrition including pesticides and other food contaminants, organic foods, sustainable agriculture, and the governmental surveillance of food and environmental toxins. It not only discusses food toxins, toxins in the U.S. food supply, and the impact of toxins on the body but also addresses current nutrition practices and their lack of connection with then environment. The book also discusses in depth the chemical structures of

pesticides, food additives, and other substances and how the chemical structures relate to the compounds' reactions. Nevertheless, the book is written in such a way as to be understood by all. This is an excellent read for the layperson and scientist alike!

- I occasionally need to fix broken IPC code and figure out behavior differences of legacy code between Solaris, Linux, etc., code written years ago by somebody else in C. This book, (and Stevens' earlier books before this) has been immensely useful. The code samples alone are worth their weight in gold :-). Seriously, this book has saved me many days of hard work, several times over. A quick browse of the book is usually enough to find the details (what I would call 'arcane details', but I guess this is because I'm not an expert C/networking programmer), figure out the problem AND how to fix the problem. This book has been a 'project-saver'. I cannot recommend this text too highly.
