Despite a quarter century of "nation building," most African states are still driven by ethnic particularism—commonly known as "tribalism." The stubborn persistence of tribal ideologies despite the profound changes associated with modernization has puzzled scholars and African leaders alike. The bloody hostilities between the tribally-oriented Zulu Inkhata movement and supporters of the African National Congress are but the most recent example

of tribalism's tenacity. The studies in this volume offer a new historical model for the growth and endurance of such ideologies in southern Africa.

Food Safety in Middle East provides the latest research data on food safety in the Arab countries of the Middle East and summarizes recent developments

on food safety practices, policies, and legislations. Food safety is a hot issue in research over the last decade due to the surge in foodborne infections, particularly in this area. Data suggest the increase is due to the foods consumed by the increasing holidaymakers and tourists. This book sums up information published in scientific literature with additional reports, knowledge and expertise to help reduce foodborne illnesses in this growing area. Beginning with the introduction of Middle East's food culture, the book addresses the food safety status in the Middle East. It dives deep in biological hazards (foodborne

infections, intoxications and toxicoinfections) and in chemical hazards in foods of the Middle East. Additionally, the book reviews current measures that are being used to control foodborne pathogens in common foods widely consumed in the area. Interestingly, important data on food safety knowledge, attitudes, and practices among food handlers in foodservice establishments in the Arab countries of the Middle East, are being thoroughly presented and analyzed. The book finally summarizes the current food safety legislations implemented at government level in certain Middle Eastern countries. It is a valuable reference for graduate students, researchers, librarians and professionals working in the food sector. • Gives an overview of the traditional foods, food safety practices, and food culture in the Middle East • Provides current research on pathogens in traditional foods consumed in the Arab countries of the Middle East • Discusses foodborne infections, intoxications and toxicoinfections to gain an understanding of causes to promote best practices • Summarizes data on chemical contaminants and residues in foods addressing potential food safety hazards in the Middle East • Discusses control measures of pathogens in common foods in the Middle East • Includes

information on policies and strategies/measures to combat food safety infections, intoxications and toxicoinfections • Presents perspectives on current and future legislations to limit foodborne intoxications to improve food safety in Middle East countries and the Gulf states

Cardiovascular disease is a major cause of mortality in the western world and about half of these deaths are caused by coronary artery disease. One of the most commonly used interventions to treat arterial blockages is to deploy an arterial stent to keep the vessel open. Traditionally, some cardiovascular

stents have been associated with serious side-effects, such as thrombosis. This book describes the fundamentals of cardiovascular stents, technologies to functionalize their surfaces and the market status of these important implants. The chapters provide specific focus on the production and evolution of cardiovascular stents, providing essential knowledge for researchers on advances in the field and knowledge of how cardiovascular stents are currently being "functionalized" in order to improve their biocompatibility and minimize negative outcomes in vivo. Global warming and globalization are the buzzwords of our time. They have nearly reached a religious status and those who deny their existence are considered modern heretics. Nevertheless, the earth has become an overcrowded village, traversable within a single day. Thus it is hardly surprising that besides persons and goods also agents of disease are easily transported daily from one end of the world to the other, threatening the health

and lives of billions of humans and their animals. Agents of diseases (prions, viruses, bacteria, fungi and parasites) are not only transmitted by body contact or direct exchange of bodily fluids, but also by means of vectors which belong to the groups of licking or blood-sucking arthropods (mites, ticks, insects) that live close to humans and their houses. Without a doubt the recently accelerating globalization supports the import of agents of disease into countries where they never had been or where they had long since been eradicated, leading to a false sense of living on a "safe island." These newly imported or reintroduced diseases - called "emerging diseases" -

may lead to severe outbreaks in cases where the countries are not prepared to combat them, or in cases where viruses are introduced that cannot be controlled by medications or vaccines. Arthropods are well known vectors for the spread of diseases. Thus their invasion from foreign countries and their spreading close to human dwellings must be blocked everywhere (in donor and receptor countries) using safe and effective measures. This book presents reviews on examples of such arthropod-borne emerging diseases that lurk on the fringes of our crowded megacities. The following topics show that there is an ongoing invasion of

potential vectors and that control measures must be used now in order to avoid disastrous outbreaks of mass diseases.

This open access book presents recent advances in the pure sciences that are of significance in the quest for alternatives to the use of animals in research and describes a variety of practical applications of the three key guiding principles for the more ethical use of animals in experiments - replacement, reduction, and refinement, collectively known as the 3Rs. Important examples from across the world of implementation of the 3Rs in the testing of cosmetics, chemicals, pesticides, and biologics, including vaccines, are described, with additional information on relevant regulations. The coverage also

encompasses emerging approaches to alternative tests and the 3Rs. The book is based on the most informative contributions delivered at the Asian Congress 2016 on Alternatives and Animal Use in the Life Sciences. It will be of value for those working in R&D, for graduate students, and for educators in various fields, including the pharmaceutical and cosmetic sciences, pharmacology, toxicology, and animal welfare. Over the last decades, acrosomal exocytosis (also called the "acrosome reaction") has been recognized as playing an essential role in fertilization. Secretion of this granule is an absolute requirement for physiological fertilization. In recent years, the study of mammalian acrosomal exocytosis has yielded some major advances that challenge the long-held, general paradigms in the field. Principally, the idea that sperm must be acrosome-intact to bind to the zona pellucida of unfertilized eggs, based largely on in vitro fertilization studies of mouse oocytes denuded of the cumulus oophorus, has been overturned by experiments using state-of-the-art imaging of cumulus-intact oocytes and fertilization experiments where eggs were reinseminated by acrosome-reacted sperm recovered from the perivitelline space of zygotes. From a molecular point of view, acrosome exocytosis is a synchronized and tightly regulated process mediated by molecular mechanisms that are homologous to those reported in neuroendocrinal cell secretions. The authors provide a broader perspective, focusing on a limited number of important topics that are essential for understanding the molecular mechanisms governing this step in the fertilization process. They also discuss molecular

aspects such as the signaling pathways leading to exocytosis, including the participation of ion channels, lipids, the fusion machinery proteins and the actin cytoskeleton as well as cellular aspects such as the site of acrosomal exocytosis and the use of gene-manipulated animals to study this process.

Scientific output in low- and middle-income countries is greatly challenged by numerous factors. This is particularly pronounced in sub-Saharan African countries, despite the continent being the world's second largest and second most-populous continent, currently undergoing rapid economic growth. Financial constraints and unclear areas of focus when funding is

available, are among the limiting factors, with the consequence being the development of inadequate policies, especially those relating to environmental protection and conservation. This 13-chapter book is a unique piece in the field of microbiology, designed to stimulate some research areas in Africa by illustrating interesting and informative examples of the current applied research agenda in environmental microbiology in selected countries within the continent. With authors from the North, South, East and West of Africa, the book touches diverse applied methods and approaches to meet the pragmatic needs faced by environmental microbiologists in Africa. Also included are topics on viruses, bacteria (including cyanobacteria), and protozoa, and their importance in disease. Sustainable agriculture and aquaculture, and eco-friendly oil and hydrocarbon bioremediation and degradation approaches are highlighted. Microbial involvement in different common indoor (e.g., household kitchens, latrines, and hospitals) and outdoor settings including air, soil, and water habitats, and their resistance to commonly used antibiotics, are described. Hopefully, the work presented here will stimulate the need for increasing modern training and

funding initiatives to prepare African microbiologists to meet the challenges they face in African universities and research laboratories.

To present a coherent and meaningful survey of scientific research endeavour in an area that has expanded as fast as physiology and biochemistry of reproduction in the male is no mean task these days. No less prodigious than the growth of knowledge of male reproductive function has been the rate at which the outpouring of publications on this subject has continued since the appearance of 'The Biochemistry of Semen and of the Male Reproductive Tract' in 1964. Since

cyclopaedic treatment of this vast literature did not appeal to us, we have made no attempt either to rehash the material contained in that book or to enlarge the bibliography beyond the nearly 3500 references included in the present treatise. At the same time, whilst writing, we felt strongly that to advance, it is necessary to understand the past, and for this reason we have not hesitated to refer (especially in the introductory chapter) to a number of those fundamental early discoveries in which today's knowledge is deeply and firmly rooted.

Multiple demographic

or economic parameters contribute to the origin of emerging infections, for example: poverty, urbanization, climate change, conflicts and population migrations. All these factors are a challenge to assess the impact (present and future) of parasitic diseases on public health. The intestine is a major target of these infections; it is a nutrient-rich environment harbouring a complex and dynamic population of 100 trillion microbes: the microbiome. Most researches on the microbiome focus on bacteria, which share the gut ecosystem with a population of uni- and multi cellular eukaryotic organisms that may prey on them. Our interest focuses on the families of eukaryotic microbes inhabiting the intestine, called “intestinal eukaryome”, that include fungi, protists and helminths. Knowledge on the reciprocal influence between the microbiome and the eukaryome, and on their combined impact on homeostasis and intestinal diseases is scanty and can be considered as an important emerging field. Furthermore, the factors that differentiate pathogenic eukaryotes from commensals are still unknown. This book presents an overview of the science presented and discussed in the First Eukaryome Congress held from October 16th to 18th, 2019 at the

Pasteur Institute in Paris. This book covers the following topics: Phylogenetic, prevalence, and diversity of intestinal eukaryotic microbes; and their (still enigmatic) historical evolution and potential contributions to mucosal immune homeostasis. Integrative biology to study the molecular cell biology of parasite-host interactions and the multiple parameters underlining the infectious process. The exploitation of tissue engineering and microfluidics to establish three-dimensional (3D) systems that help to understand homeostasis and pathological processes in the human intestine. Chlorine dioxide (ClO₂) exists as a greenish yellow to orange gas at room temperature. It is used in the paper and pulp bleaching industries as a sterilizing agent, in hospitals as a biocide in water treatment, and as an improving agent in flour. This document focuses on exposures via routes relevant to occupational settings principally related to the production of chlorine dioxide, but also contains environmental information. The health effects and environmental fate and effects of chlorine dioxide used in the treatment of drinking-water, together with those of halogenated organics produced by the interaction

between the disinfectant and other materials present in the water are covered in a recent Environmental Health Criteria publication (EHC No. 216 2000) and are not dealt with in detail here. Chlorine dioxide is an irritant and it seems likely that health effects would be restricted to local responses. The few ecotoxicity data available show that chlorine dioxide can be highly toxic to aquatic organisms.

- This story is only readable if you recognize that it was written at the turn of the century. LAST century. The dialogue, the gender roles, the overly-successful hero, and the basic ideas about Mars are so very old-fashioned. But if you recognize the time period that it was written in, then it becomes palatable. Not the best story ever, but it did keep me reading.
