Safety Theory and Technology of High-Speed Train Operation puts forward solutions for train dispatching and signal control. Frequent railway incidents have threatened the safety of rail transport. In 2013, more than 12 trains collided. In the same year, a Spanish train derailed due to speed, and two of China's high-speed trains collided. In 2016, Germany and Italy both experienced serious train collisions. Global railway security is essential. Many accidents are caused by train dispatching errors and signal system failure. Chinese high-speed railway has developed very quickly and at a very large scale. However, many issues regarding safety has not been addressed. This book considers the issue from the perspective of a system. A train operation control system structure is put forward in order to ensure safety. Five key technologies (namely system-level fail-safe, parallel monitoring, completeness of train control data, data sharing and fusion and prevention of common errors in monitoring), are proposed. In order to prevent collision, over-speed, derailment, and rear-end collision accidents, the concept and corresponding parallel monitoring technology of five core control items (train route, speed, tracking interval, temporary speed limit, train running state) is proposed. Puts forward solutions for train dispatching and signal control Views high-speed train safety and technology from a systems-theory perspective Describes five key technologies to ensure safety Proposes five parallel monitoring technologies to prevent collision, over-speed, derailment and rear-end collision incidents Considers the very quick and large-scale development of Chinese high-speed rail

Paperback. These proceedings contain the papers presented at the IFAC Symposium on Control of Power Plants and Power Systems (SIPOWER'95) held in Cancun, Mexico on 6-8 December 1995. The aim of the symposium was to lessen the gap between academic groups and industry by using the obvious interaction between power plants and power networks and the tools common to both to foster communication and encourage a more synergetic relationship. The symposium was divided equally between power plants and power systems and 104 papers were presented, representing all five continents and reflecting the international nature of the meeting. The technical sessions were organized following two main criteria: the technology used and the object being studied. Many papers fell into both categories and various topics were covered, but artificial intelligence was by far the most pervasive. There were also two plenary sessions on Control Centers and on Power Plant

This book highlights the effects of an increasing use of information technology, IT, in manufacturing. Mainly, focus is on the changes in organisation, in working procedures and in the demands on the capabilities of the personnel, both on the shop floor and the engineering and management levels. It disseminates information from the research and development carried out under ESPRIT's Integration in Manufacturing domain as well as from other activities in similar domains in industry and academia. A particular focus is on giving an overview and resume of work undertaken in the Third and Fourth Research Framework Programmes of ESPRIT.

Transactions of the American Nuclear Society Earthquakes and Multi-hazards Around the Pacific Rim, Vol. I

This is the first of two volumes devoted to earthquakes and multi-hazards around the Pacific Rim. The circum-Pacific seismic belt is home to roughly 80% of the world's largest earthquakes, making it the ideal location for investigating earthquakes and related hazards such as tsunamis and landslides. Gathering 16 papers that cover a range of topics related to multi-hazards, the book is divided into three sections: earthquake physics, earthquake simulation and data assimilation, and multi-hazard assessment and earthquake forecasting models. The first section includes papers on laboratory-derived rheological parameters as well as seismic studies in the Gulf of California and China. In turn, the second section includes papers on improvements in earthquake simulators as well as the statistical methods used to evaluate their performance, automated methods for determining fault slip using near-field interferometric data, variabilities in earthquake stress drops in California, and the use of social media data to supplement physical sensor data when estimating local earthquake intensity. The final section includes a paper on probabilistic tsunami hazard assessment, several papers on time-dependent seismic hazard analysis around the Pacific Rim, and a paper on induced and triggered seismicity at the Geysers geothermal field in California. Rapid advances are being made in our understanding of multi-hazards, as well as the range of tools used to investigate them. This volume provides a representative cross-section of how state-of-the-art knowledge and tools are currently being applied to multi-hazards around the Pacific Rim. The material here should be of interest to scientists involved in all areas of multi-hazards, particularly seismic and tsunami hazards. In addition, it offers a valuable resource for students in the geosciences, covering a broad spectrum of topics related to hazard research.

This volume collects several extended articles from the first workshop on Best Practices in Physics-based Fault Rupture Models for Seismic Hazard Assessment of Nuclear Installations (BestPSHANI). Held in 2015, the workshop was organized by the IAEA to disseminate the use of physics-based fault-rupture models for ground motion prediction in seismic hazard assessments (SHA). The book also presents a number of new contributions on topics ranging from the seismological aspects of earthquake cycle simulations for source scaling evaluation, seismic source characterization, source

inversion and physics-based ground motion modeling to engineering applications of simulated ground motion for the analysis of seismic response of structures. Further, it includes papers describing current practices for assessing seismic hazard in terms of nuclear safety in low seismicity areas, and proposals for physics-based hazard assessment for critical structures near large earthquakes. The papers validate and verify the models by comparing synthetic results with observed data and empirical models. The book is a valuable resource for scientists, engineers, students and practitioners involved in all aspects of SHA.

REVIEW OF MMI STATIONS CALCULATION AND DATA INTERPRETATION THE

- This is an inexpensive, must have, quick glance word/speller desk reference book for medical transcriptionists. Always a time saver!
- This book is extremely confusing. She throws out so many names and religions in such a short frame that it's impossible to follow along. You basically have to already have a good knowledge of all the religions she is talking about to understand what is going on. I had no knowledge of any religions prior to reading this book and it left me very confused. I only managed to read about 60 pages before I had to completely stop. I cannot believe how many positive reviews this book has.
