Orthopaedic Anesthesia, an Issue of Anesthesiology Clinics Springer

This book is designed as a technical manual addressing the rapidly evolving subspecialty of anaesthesia for orthopaedic surgery patients. It is designed to demonstrate the interaction of surgery and anaesthesia and demonstrate how this interaction influences outcome. Providing a clinically useful integration of information about orthopaedic surgery and those anaesthesia techniques used for orthopaedic patients. Concise information on regional anaesthesia, local anaesthetics and common OR problems for orthopaedic cases is included. Surgical procedures and anaesthesia issues will be combined to provide a useful reference for the practicing clinician who occasionally has an orthopaedic case, as well as those members of the anaesthesia team assigned to these cases.

Background: Virtual reality hypnosis is a combination of visual immersion in a virtual reality environment and verbal hypnosis. Virtual reality hypnosis can be used in addition to conventional techniques for sedation and pain management during wound care. Patients undergoing painful and long-lasting procedures under regional anesthesia could also benefit from this technique alleviating the need for sedative-hypnotic medication. Case report: A patient with relative contra-indications for general anesthesia underwent a lengthy orthopedic surgery under regional anesthesia with additional virtual reality hypnosis. Informed consent was obtained before surgery. A 69-year old man, with a previous medical history of COPD and severe symptomatic aortic valve stenosis (u23000.69cm2 with a max/mean gradient of 91/58mmHg) sustained a proximal humerus fracture-dislocation. He was therefore scheduled to undergo hemi-arthroplasty. Anesthesia was provided with ultrasound-guided continuous interscalene block at the C5-C6 level (11mL levobupivacaine 0.5%) combined with a single-shot superficial cervical plexus block (6mL levobupivacaine 0.5%). We used virtual reality hypnosis to induce sedation and improve comfort without using medication. This was provided by headphones and head-mounted goggles, showing computer generated images of underwater scenes (Aqua module, Oncomfort u2122). Surgery was uneventful during which time hemodynamic stability was maintained. The patient remained calm and could interact with the anesthesiologist, answering questions when necessary. He was comfortable during and satisfied after surgery. No sedative drugs were given before nor during the procedure. Conclusion: Non-pharmacological sedation can be achieved with virtual reality hypnosis. This option can be offered to patients undergoing extended surgery under regional anesthesia.

REVIEW OF ORTHOPEDIC ANESTHESIA

- My 5 year old had been trying to tie his shoes without success, and then we found this book. After reading the book, and practicing with the laces, he learned to tie his shoes in about 1 week. The colored laces seemed to make it easier for him to understand. We recommend it!
- Loved the book. It gave my child step by step instructions on how to tie her shoes. Just a perfect tool to use, the laces were the perfect length.
