REVIEW OF GEKA HYDRACROP MANUAL

• First of all, I own an H3. I use it for off-road use and it snows up here in the mountains where I live and it comes in handy. I had no idea about what the thought process was in creating this vehicle. There were a few questions I had and this book pretty much cleared them up. I would recommend

this book to all H3 owners and to those interested in what it takes and what goes into production of a vehicle. As far as I'm concerned, the H3 functions as intended. Are there things that could be better? sure, but most of those are addressed in this book. The book is well written and has great pictures. Lots of drawings and prototypes. Very well put together. The author did an outstanding job.

• For nearly two decades, the computer science department at the University of New Orleans has had the outstanding reputation of possessing one of the finest academic programs in software engineering in the south. A huge part of this reputation can be attributed to the presence of two legendary software designers at the department, Professor Fred Hosch and Professor Jaime Nino. Now, for the benefit of those who are unable to experience the expertise of these two professors first-hand, John Wiley & Sons, Inc. proudly presents An Introduction to Software Construction with Java, the very first textual authority ever to be written by Professors Hosch and Nino. Although no substitution for the professors themselves, this paperback mentor will teach you how to program and program well. Unlike any other textual teaching tools on the subject of software construction today, such as Java In a Nutshell by David Flanagan, Hosch and Nino's text is geared towards the novice programmer, that is, an introductory-level student who does not even know the meaning of the phrase "computer science." In this textbook, the authors first define what it means to be a software engineer. Then, they will take you by the hand and teach you the basic syntax and grammar of the Java language. You will learn how to define variables and construct objects. You will know what the concept of "object-oriented designing" means. Next, these authors will teach you what no other books on software that I have read thus far will teach you: how to design a good software system. These authors will teach you how to construct interaction diagrams and how to use them so that you can implement well-organized relationships between clients and servers. You will fully understand and appreciate the extremely important, yet often overlooked, concept of designing a good programming by contract relationship between objects. Often, I see textbooks presenting as examples to students implementations that Hosch and Nino would refer to as a "house of cards." In other words, the relationships between the objects in such examples are so unnecessarily complex that any minute modifications to these poor implementations will cause the collapse of their entire software structure. A programmer, by definition, is one who can implement software systems that execute properly. What, then, is the definition of a good programmer? A good programmer is one who knows how to implement software so that it can solve a problem within the least amount of time possible. How do you gauge the time complexity of a software system? Hosch and Nino will present you with a classical tool for measuring software speed that is guaranteed to increase the efficiency of your designs in no time. Other topics covered in this book include: constructing lists, guidelines to writing better comments and documentations, techniques for building maintainable and adaptive software that completely encapsulates a single notion, techniques for optimizing your software's interface via the principle of information hiding, handling exceptions and failures, developing graphical user interfaces that adhere to the model-view-controller pattern, constructing advanced containers, such as dynamic arrays, linked lists, stacks, dictionaries, queues, and hash tables, and, finally, learning how to develop your very own software library. So, if you are a software developer or are just remotely interested in the craft of software engineering, I urge you to buy this book and let Hosch and Nino, two legendary professors from the University of New Orleans, teach you the proper marksmanship of legendary programming.
