Effective Practices to Reduce Bus Accidents John Wiley & Sons

This book is intended as an introduction to classical water wave theory for the college senior or first year graduate student. The material is self-contained; almost all mathematical and engineering concepts are presented or derived in the text, thus making the book accessible to practicing engineers as well. The book commences with a review of fluid mechanics and basic vector concepts. The formulation and solution of the governing boundary value problem for small amplitude waves are developed and the kinematic and pressure fields for short and long waves are explored. The transformation of waves due to variations in depth and their interactions with structures are derived. Wavemaker theories and the statistics of ocean waves are reviewed. The application of the water particle motions and pressure fields are applied to the calculation of wave forces on small and large objects. Extension of the linear theory results to several nonlinear wave properties is presented. Each chapter concludes with a set of homework problems exercising and sometimes extending the material presented in the chapter. An appendix provides a description of nine experiments which can be performed, with little additional equipment, in most wave tank facilities.

The publication delivers numerous valuable guidelines, particularly useful when making decisions related in the subject matter to road and rail nodes located in dense transport networks. The know-how displayed while discussing practical examples as well as the decision making support systems described in the publication will certainly attract the interest of those who daily face the challenge of seeking solutions to the operational and functional problems of transport nodes in contemporary transport networks and systems. This publication is dedicated to local authorities involved in planning and preparation of development strategies for specific transport-related issues (in both urban and regional areas) as well as to representatives of business and industry, being those who participate directly in the implementation of traffic engineering solutions. The guidelines

provided in individual chapters of the publication will make it possible to address the given problem in an advanced manner and simplify the choice of appropriate strategies (including those related to synchronisation of road traffic streams, improving the capacity, road traffic safety analysis, evaluation of changes in drivers' behaviour on account of introducing countdown timers at signal-controlled intersections using UAV data, the influence of the type of traffic organisation on the behaviour of pedestrians at tram line crossings). On the other hand, since the publication also concerns the new approach to theoretical models (including potential places of integration of public transport with the railway network or the speed adviser for pedestrians enabling them to choose the optimal path at signal-controlled intersections), it should also attract the attention of researches and scientists studying this body of problems. The publication entitled "Nodes in transport networks - research, data analysis and modelling" contains selected papers submitted to and presented at the 16th "Transport Systems. Theory and Practice" Scientific and Technical Conference organized by the Department of Transport Systems and Traffic Engineering at the Faculty of Transport of the Silesian University of Technology. The conference was held on 16-18 September 2019 in Katowice (Poland).

The design and location of production facilities are important aspects of corporate strategy which can have a significant impact on the socio economy of nations and regions. Here, these decisions are recognized as being interrelated; that is, the optimal plant design (input mix and output level) depends on the location of the plant, and the optimal location of the plant depends on the design of the plant. Until the late 1950s, however, the questions of where a firm should locate its plant and what should be its planned input mix and output level were treated, for the most part, as separate questions, and were investigated by different groups of researchers. Although there was some recognition that these questions are inter l 1928; Hoover 1948; Isard 1956], no detailed analysis related [e. g. , Pre doh or formal structure was developed combining these two problems until the

work of Moses [1958]. In recent years scholarly interest in the integrated production/location decision has been increasing rapidly. At the same time that research on the integrated production/location problem was expanding, significant related work was occurring in the fields of operations research, transportation science, industrial engineering, eco nomics, and geography. Unfortunately, the regional scientists working on the production/location problem had little contact with researchers in other fields. They generally publish in different journals and attend dif ferent professional meetings. Consequently, little of the recent work in these fields has made its way into the production/location research and vice versa.

The new edition of Garber and Hoel's best-selling text focuses on giving students insight into all facets of traffic and highway engineering. Students generally come to this course with little knowledge or understanding of the importance of transportation, much less of the extensive career opportunities within the field. Transportation is an extremely broad field, and courses must either cover all transportation modes or focus on specifics. While many topics can be covered with a survey approach, this often lacks sufficient depth and students leave the course without a full understanding of any of the fields. This text focuses exclusively on traffic and highway engineering beginning with a discussion of the pivotal role transportation plays in our society, including employment opportunities, historical impact, and the impact of transportation on our daily lives. This approach gives students a sense of what the field is about as well as an opportunity to consider some of its challenges. Later chapters focus on specific issues facing transportation engineers. The text uses pedagogical tools such as worked problems, diagrams and tables, reference material, and realistic examples to demonstrate how the material is applied. REVIEW OF GARBER AND HOEL SOLUTION MANUAL HIGHWAY ENGINEERING

- Just to give a brief example, the Peasant Rebellion led by György Dózsa took place in the year 1514, forty-six years before Erzsébet Báthory was born. Yet Codrescu has Dózsa killing family members of Countess Báthory in front of her eyes. The book is nothing more than anti-Hungarian propaganda written by a (Romanian) with a political agenda. An earlier book by Codrescu, "The Hole in the Flag" was an noble effort, but "The Blood Countess" is disappointing to say the least.

- Star Trek-New Frontier: Gods Above written by Peter David is an adventure that takes you on a ride of a lifetime. This book continues where "Being Human" has left off and takes us through an interesting story about The Beings. The Beings are made of energy

and can take the shape of Earthlike pseudo-Egyptian-Greco-Roman-Norse-Mesopotamian-Gods i.e. Apollo, Artemis, Thoth, Anubis, Woden, and Hermes just to name a few. The Beings need worship to derive their energy and to get the people to worship them they hand out ambrosia to guarantee continued compliance. This book continues the storyline of Mackenzie Calhoun the captain of the U.S.S. Excalibur along with Captain Elizabeth Shelby for the U.S.S. Trident as they face these god-like beings in a show down. Freedom of thought vs. total compliance and worship of a pseudo-god are what's at stake. This book takes us from the Excalibur to the Trident to the planet Danter as we read on. There are twists and turns as McHenry is in a self-imposed state of stasis and is experiencing out of body experiences. The Danteri run off SiCwan

and Kalinda as the Thallonians tried to pose a government with them as the head, only to be rescued by an icon in the Trek universe. This is a well-crafted story with plenty of action-adventure to go around. The beginning of the book is a little slow going as David sets-up the story, but there is plenty of character interaction and interplay to make the story interesting as it begins to take stride. There is a good space battle scene and as space begins to open up and things happen. There are scenes in this book that take us back to adventures of Kirk and crew and the original Enterprise-1701. All in all, this was a good, fast and interestingly enjoyable read. I gave it a solid 5 stars and it is worth the purchase price. A point of fact, I have NOT read anything by Peter David that was a dud, he is a very entertaining author that writes a well-told story.
