Harmonic Wave Systems is the first textbook about the computational method of Decomposition in Invariant Structures (DIS) that generalizes the analytical methods of separation of variables, undetermined coefficients, asymptotic expansions, and series expansions. In recent years, there has

been a boom in publications on propagation of nonlinear waves described by a fascinating list of partial differential equations (PDEs). The vast majority of wave problems are reducible to one-dimensional ones in propagation variables. However, a list of publications with two- and three-dimensional applications of the DIS method is brief. The book offers a comprehensive and rigorous treatment of the DIS method in two and three dimensions using the PDE approach to the Helmholtz decomposition that provides the most general background for mathematical modelling of harmonic waves in fluid dynamics, electrodynamics, heat transfer, and other numerous areas of science and engineering, which are dealing with propagation and interaction of N internal waves.

Experimental Hydrodynamics for Flow around Bodies explains complex novel experimental methodologies to solve a wide range of important flow problems in industry and research. The book starts by examining the fundamental physical laws necessary for the optimization of techniques for hydro-aeromechanics, heat engineering, and other disciplines related to flow. The reader is then provided with detailed explanations of novel experimental methods, along with the results of physical research. These results are also necessary for the construction of theoretical models that provide improved descriptions for numerous problems in various scientific fields. Frequent discussions, examples of

practical applications throughout the text, and foundational, theoretical materials help a range of readers engage and apply these methods to problems in fields including drag reduction, noiseless movement, optimal maneuvering, intense heat transfer, control of separated vortices, wind power, economical energy consumption, and more. Provides instructions on the set up of innovative experiments for drag reduction that will be of great interest to researchers in aerospace, marine and automotive engineering. Describes, in detail, a variety of novel experiments to investigate boundary layer flow, together with experimental data that can be used with computational models. Assists with bio-inspired hydrodynamic design by providing models of a waving fin mover and investigations of analogs of hydrobiont skin covers.

The steady increase in computational power induces an equally steady increase in the complexity of the engineering models and associated computer codes. This particularly affects the modeling of the mechanical response of materials. Material behavior is nowadays modeled in the strongly nonlinear range by taking into account finite strains, complex hysteresis effects, fracture phenomena and multiscale features. Progress in this field is of fundamental importance for many engineering disciplines, especially those concerned with material testing, safety, reliability and serviceability analyses of engineering structures. In recent years many important achievements have been made in the field of the theoretical formulation, the mathematical analysis and the numerical implementation of deformation processes in solids. Computational methods and simulation techniques today play a central role in advancing the understanding of complex material behavior. Research in the field of "Computational Mechanics of Materials" is concerned with the development of mathematical models and numerical solution techniques for the simulation of material response. It is a very broad interdisciplinary field of science with inputs from traditional fields such as Applied Mechanics, Applied Mathematics, Materials Science, Solid State Physics and Information Technology. The intention of the IUTAM Symposium "Computational Mechanics of Solid Materials at Large Strains", held at the University of Stuttgart, Germany, from August 20-24, 2001, was to give a state of the art and a survey about

recent developments in this field and to create perspectives for future research trends.

REVIEW OF 12 CC 3 F P M SWIMSWAM

- The Book "The Giver" plays in the future. There is a community which is ruled by a Receiver and some elders who tells the inhabitants what to do. One of these inhabitants is Jonas who is selected to take over the most important job in the community. I didn't like the book very much because I don't like such unreal stories. I think the author wrote too much unrealistic things, for example I can't understand why the community has developed into what

they are in the story. Many things that are part of over our lives were abolished (also all dangers) and I can't quite understand why...Metal Rulez !!!

- This is a classic. It's hard to find good science fiction in juvenile fiction. The perfectly ordered world is not all that it seems. Jonas is tested with the knowledge gained as the Giver. He will learn of another kind of world - one with war, pain, love, color, etc. As a result, his relationships with his family and friends are altered. This is a terrific book club selection or class read as it invites discussion. What would our world be like without color or emotion? Could a world be ruled by order? The Giver is best suited to a little older, sophisticated reader - an advanced 10-year old up through adult.
