In the early 1960s, the emergence of the theory of plate tectonics started a revolution in the earth sciences. Since then, scientists have verified and refined this theory, and now have a much better understanding of how our planet has been shaped by plate-tectonic

processes. We now know that, directly or indirectly, plate tectonics influences nearly all geologic processes, past and present. Indeed, the notion that the entire Earth's surface is continually shifting has profoundly changed the way we view our world.

This book begins with a lesson on the nature of astronomy, and then it covers the major structures of our solar system. Starting with the sun and working towards Pluto, the student will learn details about all nine planets (or is it eight? - your student will have to decide) in the solar system. Along the way, the student will also learn about Earth's moon, the asteroid belt, and the Kuiper belt. After that, the student will move

outside our solar system and learn about the stars and galaxies that make up God's incredible universe. Finally, the student will learn about space travel and what it takes to be an astronaut! The activities and projects use easy-to-find household items and truly make the lessons come alive! They include making a solar eclipse, simulating the use of radar to determine a hidden landscape, and making a telescope. We recommend that you spend the entire school year covering this book, devoting approximately two sessions per week to the course.

The use of infrasound to monitor the atmosphere has, like infrasound itself, gone largely unheard of through the years. But it has many applications, and it is about time that a book is being devoted to this fascinating subject. Our own involvement with infrasound occurred as graduate students of Prof. William Donn, who had established an

infrasound array at the Lamont-Doherty Geological Observatory (now the Lamont-Doherty Earth Observatory) of Columbia University. It was a natural outgrowth of another major activity at Lamont, using seismic waves to explore the Earth's interior. Both the atmosphere and the solid Earth feature velocity (seismic or acoustic) gradients in the vertical which act to refract the respective waves. The refraction in turn allows one to calculate the respective background structure in these mediums, indirectly exploring locations that are hard to observe otherwise. Monitoring these signals also allows one to discover various phenomena, both natural and man-made (some of which have military applications).

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make

informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall

organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

## **REVIEW OF LAYERS OF THE ATMOSPHERE FOLDABLE ANSWERS**

- This is simply the worst book I remember reading. I enjoyed a couple other Jack Higgins novels, so I happily picked this up. I'm sorry I did. It is nothing but action, which might be OK for a fun read on the beach, but even the

action is so poorly written it is ridiculous. Massive action scenes (such as large battles) take place in only 1 or 2 pages. There's no character development, poor dialogue, no setting descriptions, no drama or suspense -- nothing but a poorly-described series of "events"! Enough said.

- Hawthorne's "The Scarlet Letter" is a novel still being deciphered by the greatest of scholars to this day. This is a testament to its originality and complexity. But do not be intimidated by this. This novel tells a story which

everyone should be able to comprehend if time is given. Hawthorne clouds this novel with so many minor details and facts, but in between all of this lies a plot and message that is worth the read. If you are reading this for high school, I recommend you buy the cliff notes also, but **ONLY TO READ ALONG WITH THE NOVEL FOR A BETTER UNDERSTANDING!!!** This is an extremely hard book to read without guidance, so if your looking at this novel for recreational purpose, it is best that you are someone who loves to read and analyze whenever possible. I give this novel a 3.5
